

# SHIP

The truth about me

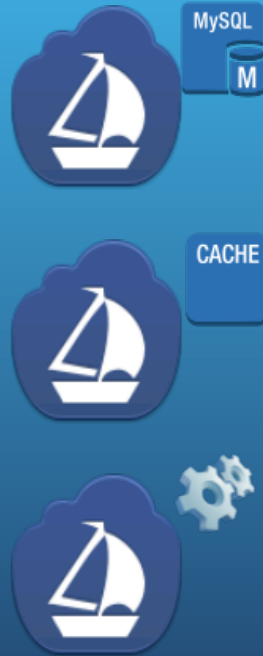

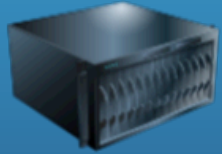

Alberto Ferreira  
bsurfer@gmail.com

<https://github.com/bsurfer/ship>

# Purpose

HOST

SHIP's

- Have various services in same host
- Shared resources
- Isolated services
- Isolated IP Address

# What is?

- It's nothing more than a, normal, chroot where you can run distributed applications and services
- Enable services to be quickly installed and configured

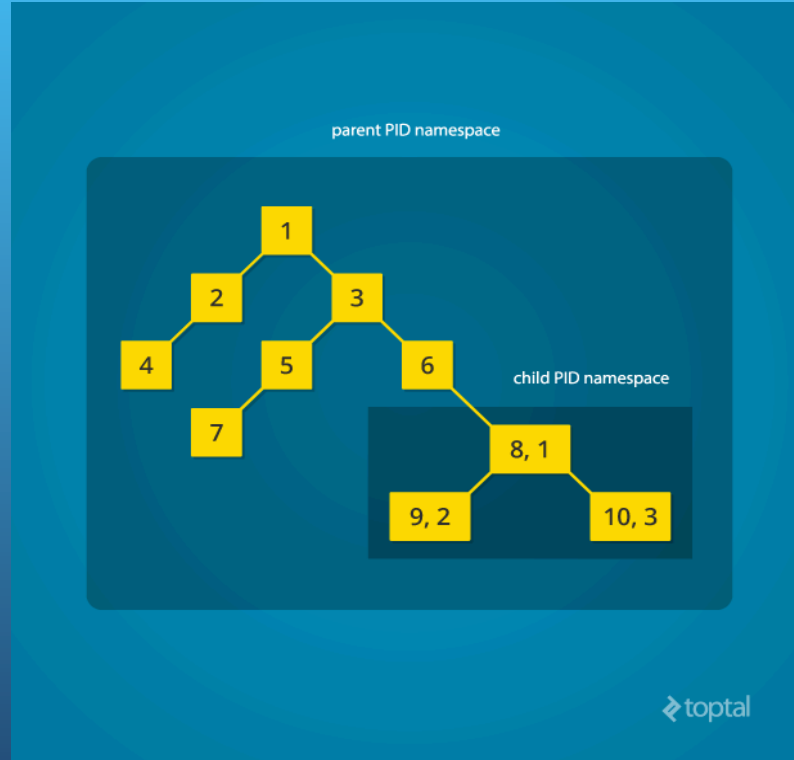

# Features

- Run like a normal SO
- All services are isolated
- /proc and /sys are host independent
- It's possible to have one or more network interfaces
- CLI to start/stop/connect in to ship
- Portable
- Run different versions of debian OS

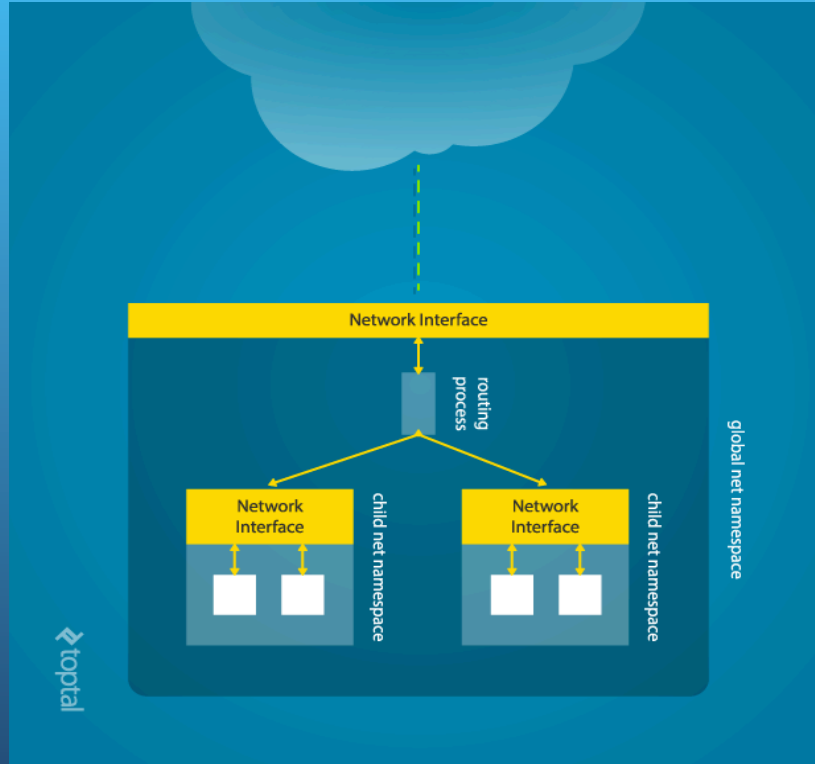

# Tecnologies

- unshare
- namespaces
- nsenter
- openvswitch

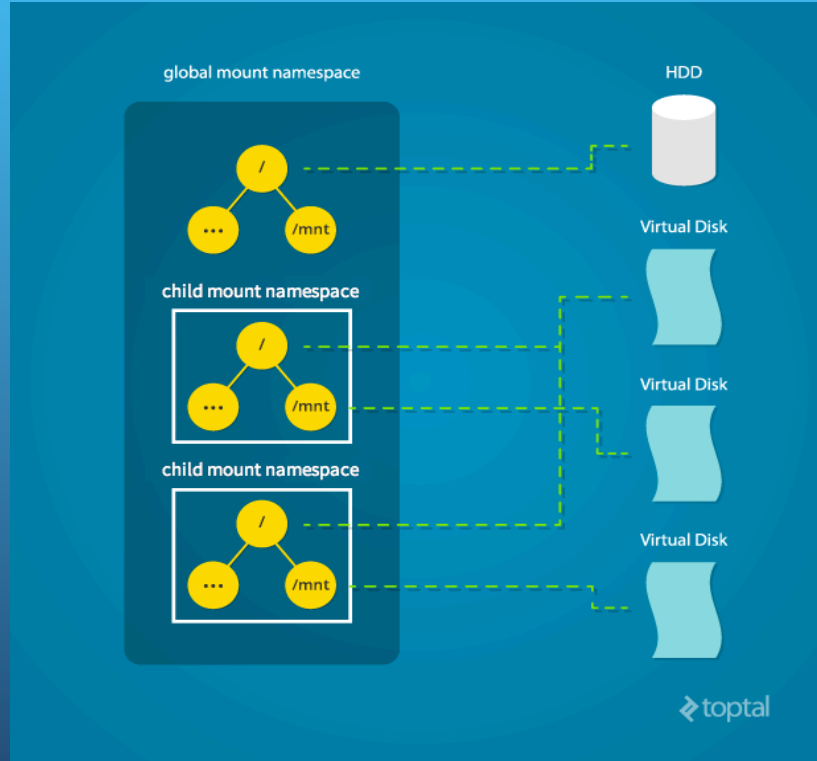

# Process Namespace

# Network Namespace

# Mount Namespace

# Challenges

- unshare, in Debian, the option -p and -f is missing by default
- Start a ship like a normal startup
- Ship's can't communicate with the host, via ssh

# Code tree

```
ship
|-- bin
|   |-- nsenter
|   `-- unshare
|-- config
|   `-- ship.cfg
|-- config_files
|   |-- interfaces
|   |-- interfaces_ovs
|   `-- start_chroot
`-- scripts
    |-- shipmn
    `-- shipmns
```

# Some code

Config File:

```
f = file('/etc/ship/config/ship.cfg')  
cfg = Config(f)  
farm_folder=cfg.farm_folder  
config_folder=cfg.config_folder  
pid_folder=cfg.pid_folder
```

# Some code (Cont)

- Check if IP is valid and if is being used:

```
def valid_ip(ip):  
    try:  
        socket.inet_aton(ip)  
        return True  
    except socket.error:  
        return False
```

```
def ping_ip(ip):  
    try:  
        sh.ping(ip, "-c 1", _out="/dev/null")  
        return True  
    except sh.ErrorReturnCode_1:  
        return False
```

# Some code (Cont)

- Create network interface:

```
def create_network(chroot):  
    print 'Create Network'  
    os.system('ip link delete %s' %(chroot) )  
    os.system('ip link add %s type veth peer name veth0' %chroot)  
    os.system('ovs-vsctl del-port ovsbr %s; ovs-vsctl add-port ovsbr %s' %(chroot,chroot) )  
    os.system('ifconfig %s promisc' %chroot)  
  
def create_network_stage2(pid,interface):  
    print 'Put interfaces %s UP!!! PID: %s' %(interface,pid)  
    os.system('ip link set netns %s veth0' %pid)  
    os.system('ifconfig %s promisc' %interface)  
    os.system('ifconfig %s up' %interface)
```

# Some code (Cont)

- Start Ship

```
start_network(value)
if get_interfaces(value) is '2':
    create_network_wan(value)
father_hostname(value)
cmd=('setsid %sbin/unshare -m -p -u -n -f chroot %s%s /etc/init.d/start_chroot ') %
    (config_folder,farm_folder,value)
print 'Launch Chroot'
p_pid = subprocess.Popen(['/bin/bash', '-c', cmd]).pid
time.sleep(1)
pid = get_start_pid(p_pid)
create_pid(pid,value)
create_network_stage2(pid,value)
if get_interfaces(value) is '2':
    create_network_stage2_wan(pid,value)
```

# Some code (Cont)

- Stop Ship:

if status\_chroot(value) is True:

```
    pid=int(get_pid(value))
```

```
    print 'Shutdown: %s Pid: %s' %(value,pid)
```

```
    os.kill(pid, signal.SIGTERM)
```

```
    delete_pid(value)
```

- Go inside the Ship:

if get\_pid(name) is not False:

```
    cmd=('%sbin/nsenter -t %s -m -u -p -n chroot %s%s ' ) %
```

```
    (config_folder,get_pid(name),farm_folder,name)
```

```
    os.system(cmd)
```

# Usage

Usage: shipmn [options]

## Options:

create	create new ship using debootstrap
status	ship's status
start all	start all ship's
start ship_name	start ship
stop all	stop all ship's
stop ship_name	stop ship
con ship_name	enter in ship

# Future

- Web Interface:
  - Ship's status
  - Statistics
  - Running process
  - Create/delete/clone Ship's
- Cgroups integration
- Clone ship's
